## Laser Pointer Activity Student Data Tables

## Part 1. Light Interaction

Data Table 1

|  | Observations |
| :--- | :--- |
| Green filter |  |
| Red filter |  |
| Blue filter |  |

Data Table 2

|  | Observations |
| :--- | :--- |
| Green filter |  |
| Red filter |  |
| Blue filter |  |

Data Table 3

|  | Observations |
| :--- | :--- |
| Laser through <br> polarizer |  |
|  |  |

## Part 2. Reflection

Data Table 4

| Incident Angle | Reflected Angle |
| :---: | :---: |
| $30^{\circ}$ |  |
|  |  |
|  |  |
|  |  |

## Part 3. Refraction

Data Table 5a

|  | Observations |
| :--- | :--- |
| Original beam <br> compared to <br> beam traveling <br> through water |  |
|  |  |

Data Table 5b

| Incident Angle | Reflected Angle |
| :---: | :---: |
| $30^{\circ}$ |  |
|  |  |
|  |  |
|  |  |

## Data Table 6

|  | Observations |
| :--- | :--- |
| Internal <br> Reflection |  |
|  |  |
|  | Total Internal Reflection Minimum Angle: |

## Part 4. Diffraction

Data Table 7

|  | Diffracted Angle |
| :--- | :---: |
| Left Bright Line $^{\circ}$ |  |
| Right Bright Line |  |
| Average |  |

Data Table 8

| Incident Angle | Diffracted Angle |
| :--- | :--- |
| Upper Left Bright L ine |  |
| Upper Right Bright Line |  |
| Average |  |
| Lower Left Bright Line |  |
| Lower Right Bright Line |  |
| Average |  |

1. Which color filter transmitted the most light? Explain.
2. Which colored paper reflected the most light? Explain.
3. Explain why the blue and green strips of paper also reflected red light.
4. According to your observations of laser light traveling through a polarizing filter, is laser light polarized?
5. In your own words, explain the law of reflection. (Optional: What mathematical equation describes the law of reflection?)
6. (Optional) Assume a person is standing in front of a vertical mirror. What is the minimum height the mirror must be in order for a person to see his or her entire reflection.
7. Snell's law is given by:

$$
\mathrm{n}_{1} \sin \theta_{1}=\mathrm{n}_{2} \sin \theta_{2}
$$

Equation 2
$\mathrm{n}_{1}=$ index of refraction of incident medium
$\theta_{1}=$ incident angle of light beam (with respect to the vertical) at the media boundary
$\mathrm{n}_{2}=$ index of refraction of exiting medium
$\theta_{2}=$ exiting angle of light beam (with respect to the vertical) at the media boundary
Use Equation 2, and the data from Experiment 5, to determine the index of refraction of water.
8. The accepted value for the index of refraction of water at $20^{\circ} \mathrm{C}$ is 1.333 . How do your results compare with the accepted value?
9. When total internal reflection first occurs (the critical angle), where does the transmitted beam go?

10. Using Snell's law (Equation 2), and the critical angle measured in Experiment 6, determine the index of refraction of the plastic dish. Use the accepted value for the index of refraction of water found in Question 8.
11. Can total internal reflection occur when light travels from air into water? Why or why not?
12. From the data collected in Experiment 7, use Equation 1 (found in the Background section) to determine the wavelength of the laser light. The number of lines per millimeter of the diffraction grating is 950 lines $/ \mathrm{mm}$.
13. Were the diffracted light lines brighter or dimmer than the center line?
14. Why are the locations of the bright bands different when the light diffracts in air compared to when the light diffracts in water?
15. Determine the index of refraction of water using Equation 1, Equation 2, and the data collected in Experiment 8.
